Constants: Fixed values are called constants. Constant value should be provided at the time of declaration only. i.e. further initializations not allowed.

Every variable having 2 stages.

1. Variable declaration
   Eg: int a;
2. Variable initialization
   Eg: a=100;

Example for constants:

Numerical constants:

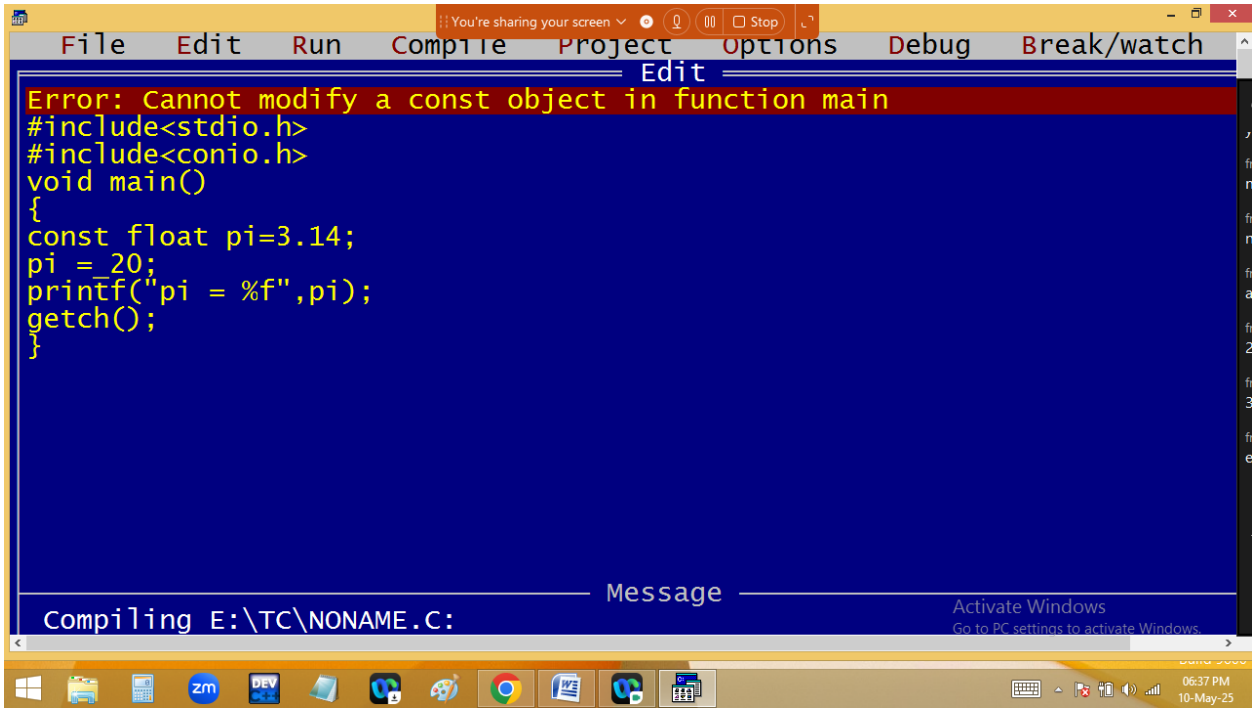

const float pi = 3.14;

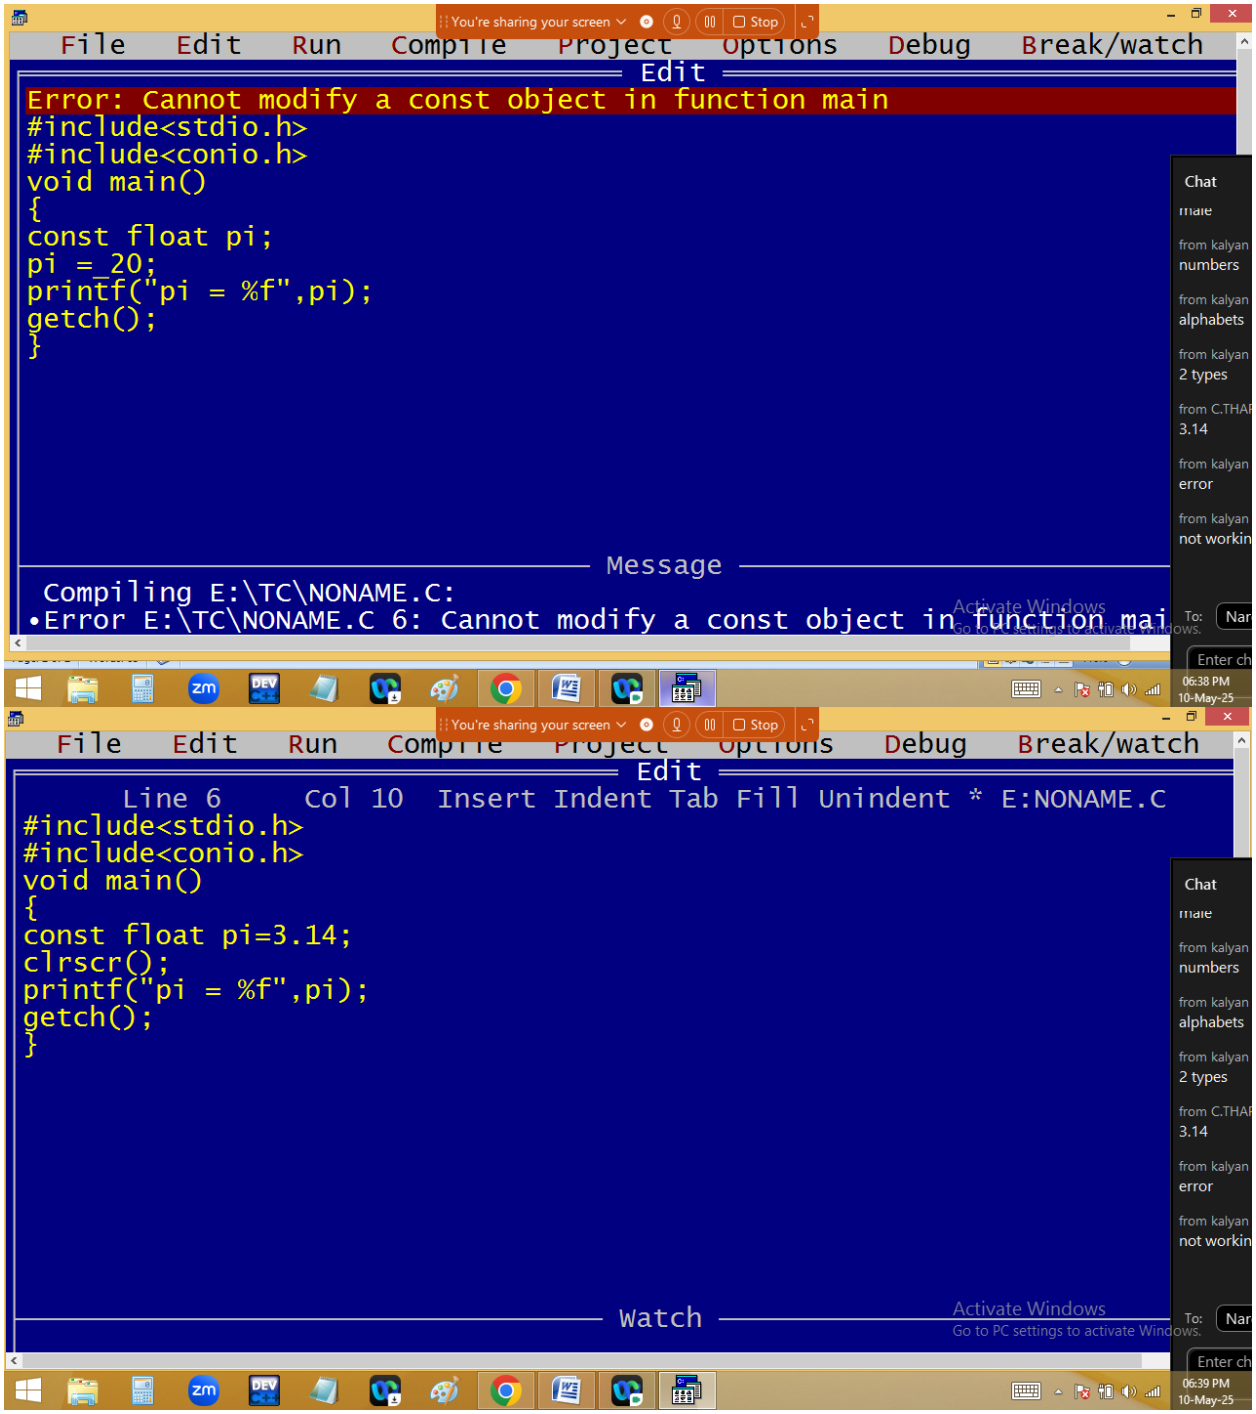

const int rollno=1234;

character constants:

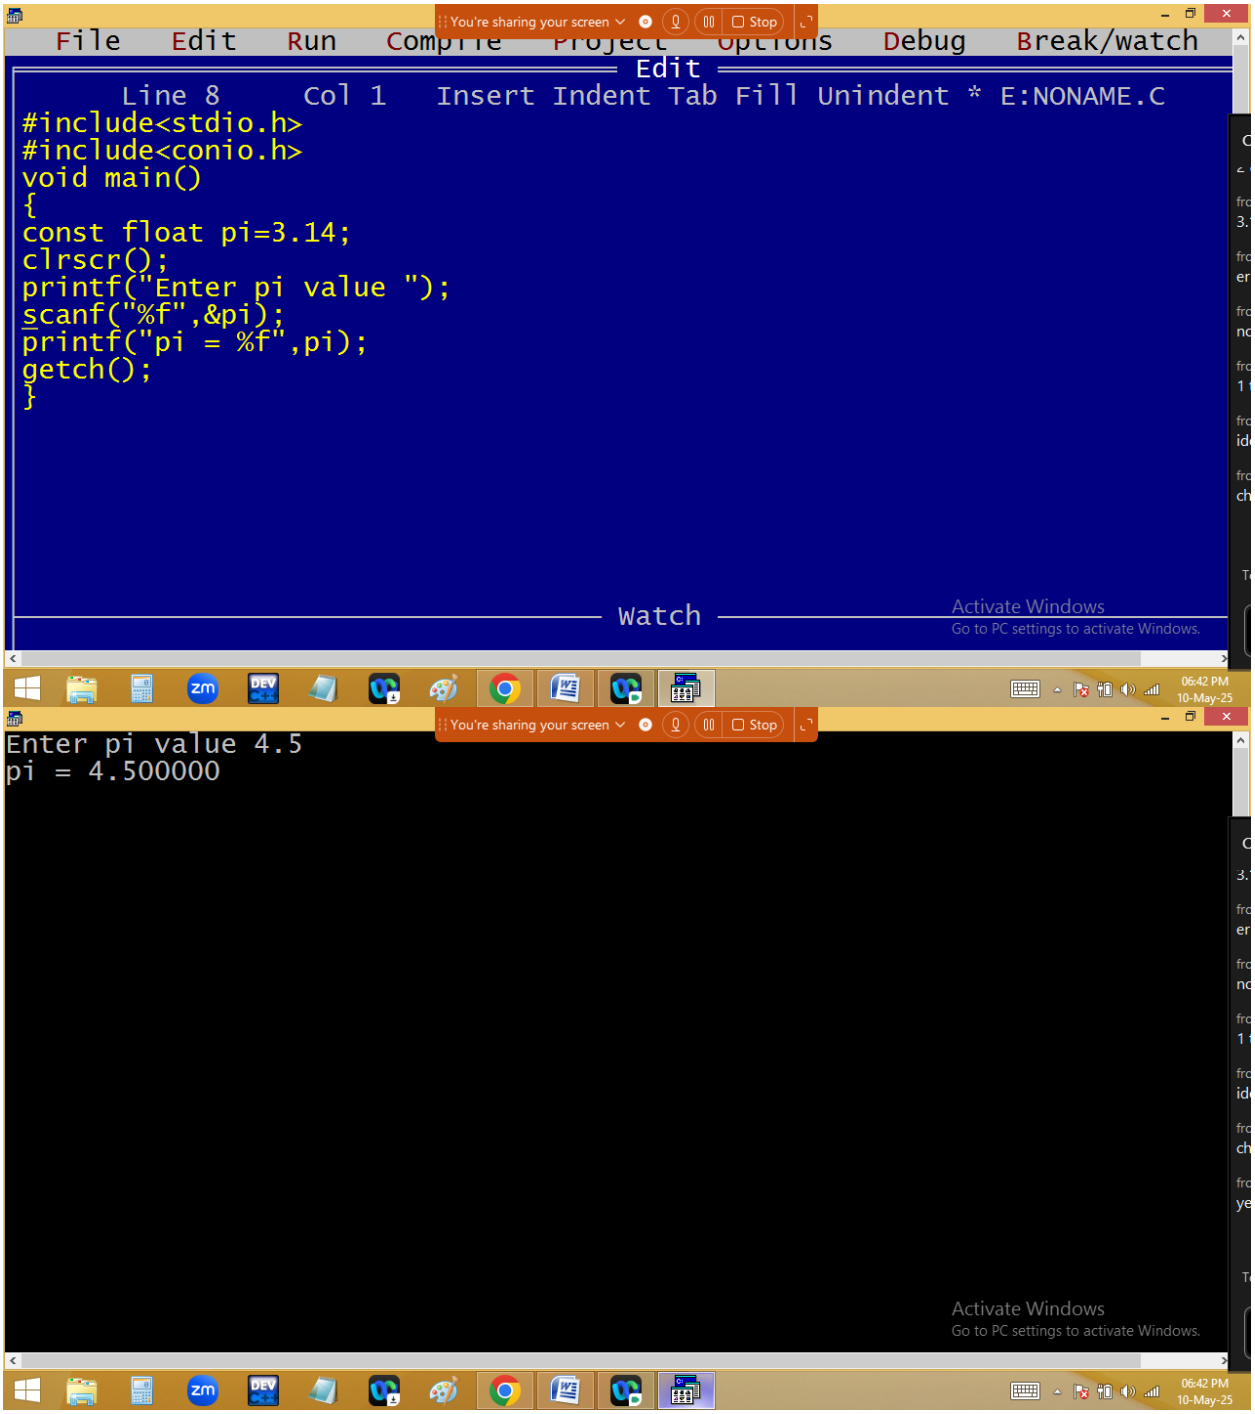

const char name[10]=”Ravi”; ← string constant

const char gender=’**M**’; ← char constant

We can change the constant value through scanf().

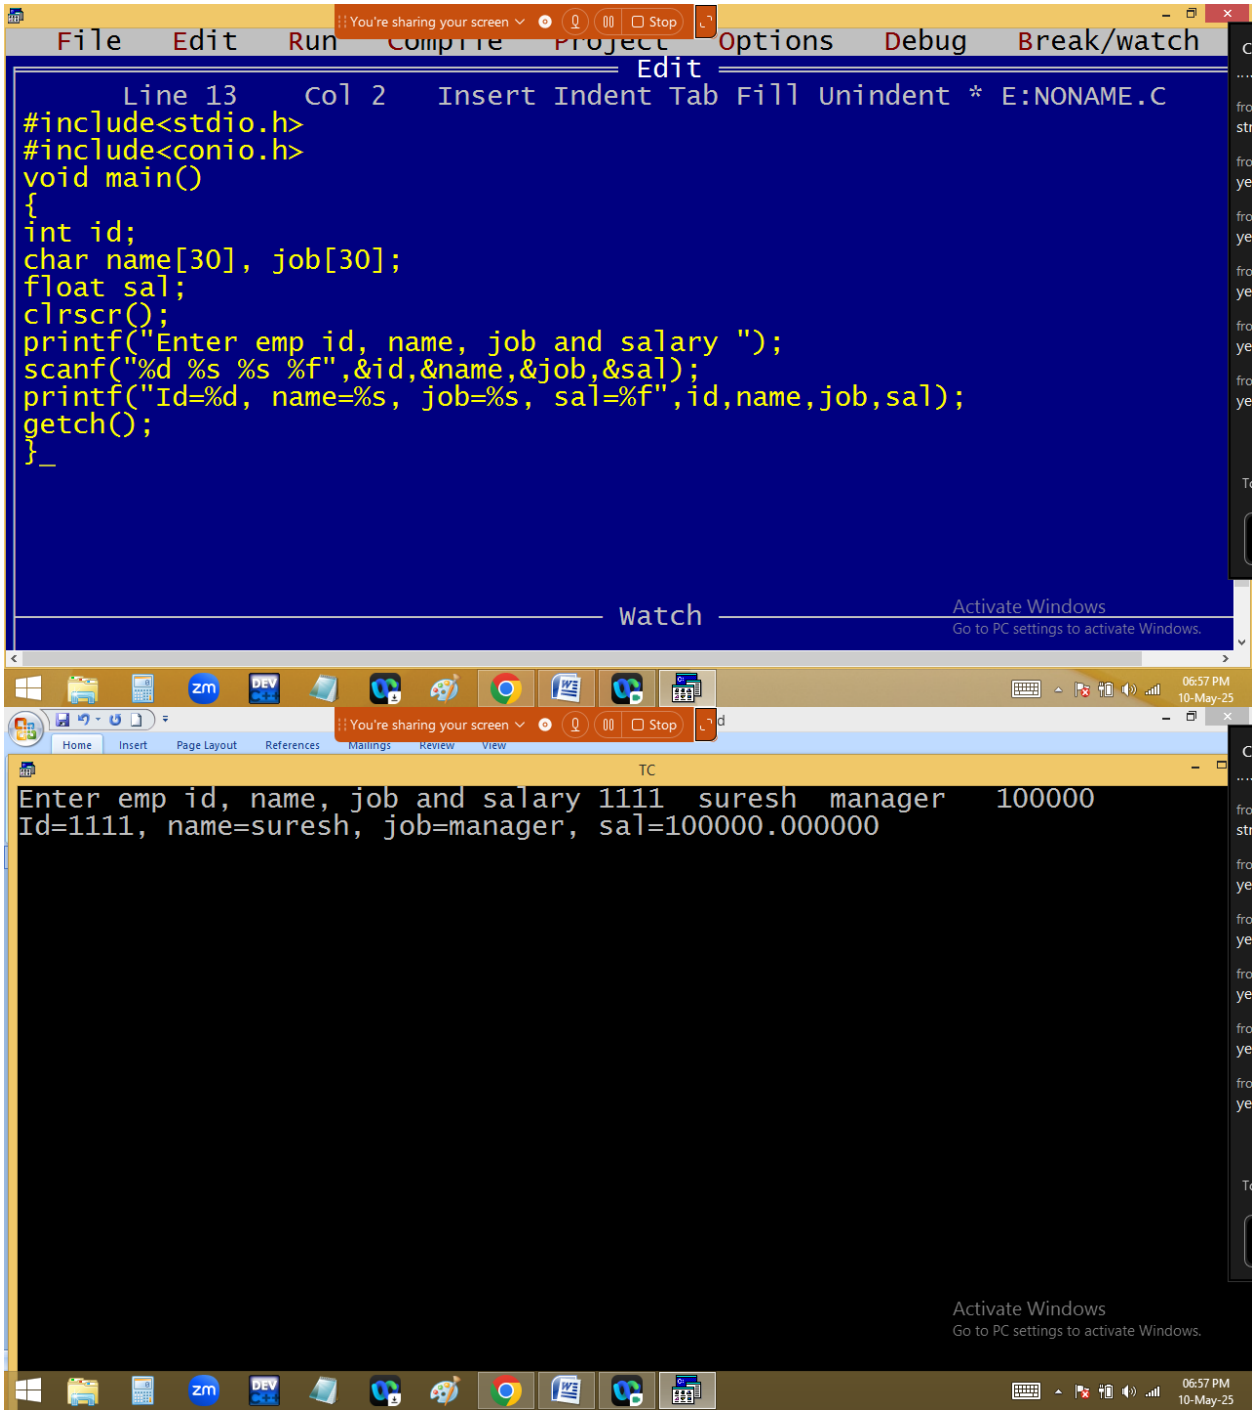

scanf(): It is a predefined function is used to read the values from user at runtime.

Reading and printing stu id, name, height from user using scanf().
