Wednesday Lab

1. Data Types and Printing:
    a. Write a C program that declares variables of type int, float, and char. Take values from the user and print these values.
2. Integer and Float Division:
    a. Write a program that takes one integer and one float as input, performs division, and multiplication and prints the results.
3. Temperature Conversion:
    a. Create a program that converts a temperature from Celsius to Fahrenheit. Take the temperature in Celsius as input and use float for calculations.
    Fahrenheit = (celsius * 9 / 5) + 32
4. Calculating the Perimeter of a Rectangle:
    a. Write a program that takes the length and breadth of a rectangle as input and calculates the perimeter. Print the result.
5. Sum of Digits:
    a. Write a C program that takes a two-digit integer as input, calculates the sum of its digits, and prints the result.
6. Swapping Two Numbers:
    a. Write a program that swaps two integers provided by the user and prints the swapped values.
